

CINOGY Technologies beam profilers are available with the specifically designed analysis software, RayCi, which supports Vista / Windows 7 / 8 / 10 operating systems. It is available as 32 Bit / 64 Bit version and can control several beam profiler cameras on a single computer simultaneously.

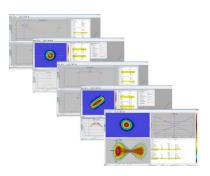

Due to its clearly designed menu structure, RayCi shows self-explanatory functions, which help the user to access quickly standard settings. Incomparable visualization modes, extensive analytical capabilities as well as new developed correction algorithms ensure the highest accuracy in laser beam analysis.

A wide range of beam width techniques e.g. 2^{nd} Moment, Knife Edge, Moving Slit, Plateau and Gauss-Fit can be applied to determine quick and reliable standard beam parameters. The unique measurement tool enables the continuous monitoring of beam parameters, beam position and power density distribution. Moreover a new beam quality M^2 tool enables accurate beam quality analysis.

The extraordinary graphical and analytical tool of RayCi can be used for live data (LiveMode) and stored data (SaveMode) simultaneously, while each mode has its own individual functions. This makes RayCi the most advanced analysis software on the market. Helpful features like AOI Tracking, AOI Optimization, Zoom Functions, Look-Up Tables, etc. simplify the laser beam analysis.

RayCi is equipped with flexible data and image output capabilities. This permits the user to store data and images in the format that is compatible with their needs. A clearly arranged and printable protocol view displays the measurement parameters as well as the most important laser beam analysis results.

CINOGY'S laser beam profiler can easily be integrated in different automation systems and processes. The supplied Software Development Kit (SDK) based on a XML-rpc interface. The user can write programs in a number of platforms, such as Python, Visual Basic, LabVIEW, etc. which will remote-control the beam profiler.

Beam Profiler Software RayCi - Visualization Options -

× [px] () ///20/60

RayCi's incomparable illustration capabilities ensure the optimal visualization of measurement results during beam profiling. Several visualization windows allow the monitoring and analyses of live data and previously stored data simultaneously. Thanks to its clearly designed menu structure and the self-explanatory functions RayCi can easily be operated by any user.

CINOGY Technologies GmbH

RayCi features a unique laser beam measurement technique – the measurement of time series. It allows beam profile acquisition and evaluation not only as single measurement but also as a sequence of consecutive measurements with a selectable interval. Thereby RayCi enables a continuous monitoring and analysis of laser beam parameters and their temporal behavior automatically.

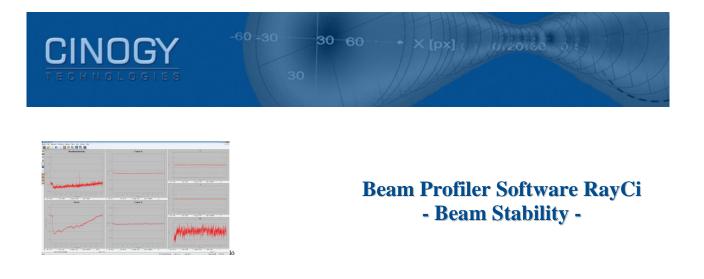

Examination

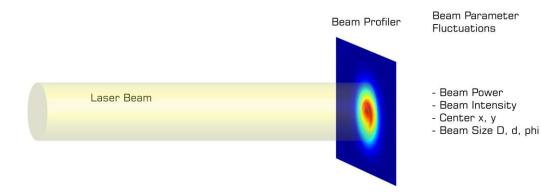

Each measured laser beam profile, acquired either as single measurement or as time series, is completely analyzable by the full range of RayCi's sophisticated analytical methods, e.g., beam width techniques, arithmetic operations, filters, image transformations, and optimization features and can be visualized as 2D, 3D, Cross-Section and Histogram.

Option Window

List of all individual measurements of the time series.

For high-precision laser beam applications is it important to know the temporal behavior of the laser beam parameters. Thus, RayCi continuously measure, analyze and monitor standard laser beam parameter according to ISO standard. This unique stability tool is indispensable for today's laser beam applications. The enhancement of product quality, process reliability and efficiency are just a few of the many benefits of this measurement option.

CHARTS:

Power

Depicts the values of the power (δ Power) versus time. Minimum, maximum, average and standard deviation values are shown.

Peak

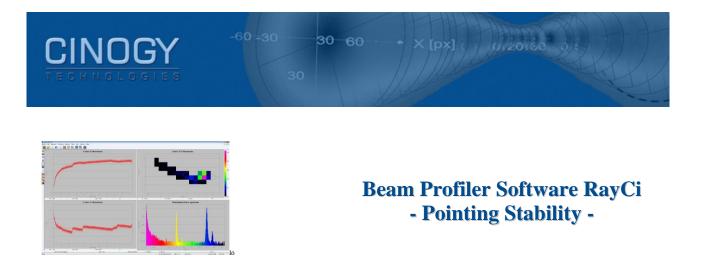

Depicts the values of the peak (δ Peak) versus time. Minimum, maximum, average and standard deviation values are shown.

Centroid X / Y

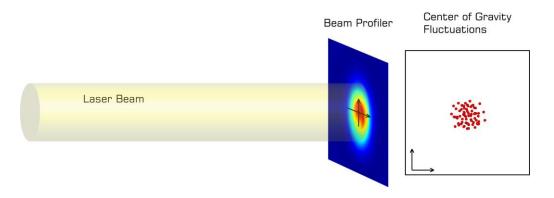

Depicts centroid x and centroid y positions of the laser beam versus time. Minimum, maximum, average and standard deviation values are shown.

Beam Width (D, d, Phi)

Depicts the values of the beam width versus time. Minimum, maximum, average and standard deviation values are shown.

The pointing stability is one of the essential parameter of today's laser applications. The laser process is highly sensitive to several internal and external effects. The consequences are beam position fluctuations, which can cause significant problems. For such reasons a quantitative measure of the beam pointing stability is of importance. RayCi continuously measures the beam pointing stability according to ISO 11670 calculated by the centroid.

CHARTS:

X-Fluctuation

Depicts the centroid fluctuation in x-direction (δX). Minimum, maximum and standard deviation values are shown.

Y-Fluctuation

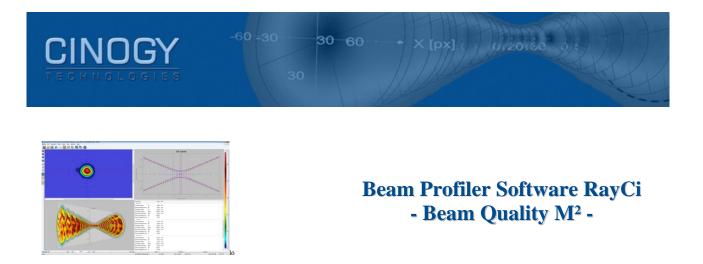

Depicts the centroid fluctuation in y-direction (δY). Minimum, maximum and standard deviation values are shown.

Centroid Position Analysis

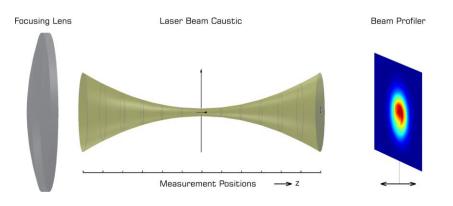

Monitors the centroid fluctuations in x- and y- directions. The frequency of occurrence is displayed in different colors. Additionally, RayCi calculates the 2nd moments of this distribution as ellipse. The respective characteristics of the ellipse are listed.

Power Spectrum

Depicts the frequency spectrum of the centroid fluctuations.

The knowledge of the laser beam quality is one of the essential characteristic for today's laser material processes. The beam quality factor M2 indicates the focusing ability of the laser. The best possible beam quality M2 = 1.0 is achieved for a Gaussian TEM00 beam. The closer M2 is to 1.0 the better the beam can be focused. M2 is measured according to ISO 11146-1 / 2 by focusing the beam and measuring several beam profiles along the beam caustic.

CHARTS:

2D-View

Displays the currently beam profile measured along the beam caustic. The user can click any individual beam profile to observe the beam propagation.

2D-Caustic Fit

This view presents the beam widths at all measured z-positions. RayCi extrapolates a hyperbola fit to these data meaning the caustic x fit, caustic y fit and caustic fit. The beam waist position and the Rayleigh length are shown automatically.

3D-Caustic Fit

The unique 3D tool displays the individual beam profiles at each measured z-position. Additionally, the caustic x fit, caustic y fit and 3D-caustic fit are illustrated.

Results

Displays the calculated results such as beam waist diameter (do), Rayleigh length (zR), divergence angle (θ), M2, K, ect. by using ISO 11146-1 or ISO 11146-2 standards.

The exact knowledge of beam parameters is essential for the success of laser processes. RayCi provides a wide range of beam width techniques according to ISO 11146 to calculate quick and reliable standard beam parameters. The beam parameter results depend on the selected beam width technique. For every laser beam shape, intensity profile and mode structure RayCi offers the respective technique. The calculated beam width is depicted in the 2D-View (circular), 3D-View (circular cylinder, gauss distribution curve), and Cross Section (lines, gauss distribution curve).
